Aleksei Mikhailov

Lead iOS Engineer | Mobile Architecture | FinTech & Web3 | AI Enthusiast

Belgrade, Serbia

Summary

I’ve spent the past 10+ years building iOS products, often joining when the product still has more open questions than settled architecture.At Lionsoul Global, I took the iOS application from its initial product stage to the App Store. I designed its modular VIPER-style architecture, built an internal design system and worked on security, networking, analytics, feature flags, deep links and release automation.My earlier work spans Web3, loyalty products, social applications and client projects. I worked on SORA Wallet and its Polkaswap integration at SORAMITSU, built location-based functionality for MILE·ON·AIR and shipped the Cordis MVP from early product discussions to release.Before that, I co-founded a small mobile development studio while studying. Alongside iOS development, I handled requirements, estimates, client communication and delivery. One of our applications reached the Top 7 in the App Store Sports category on its first day.I use AI in day-to-day engineering work for research, implementation and workflow automation. I treat generated output like any other engineering input: I review it, test it and remain responsible for the result.Based in Belgrade. Open to Lead iOS Engineer and senior individual-contributor roles across Europe, including remote, hybrid and relocation.

Experience

Lionsoul Global

Lead iOS Developer
April 2022 - October 2026 (4 years 7 months)

Took ownership of iOS development from the first product stage to the App Store release. I designed a modular VIPER-style architecture, reusable module factories and navigation flows, and built Lionsoul System Design, our internal UI component library.

The application included Keychain-based token storage, biometrics, device integrity checks, emulator detection and SSL pinning. I also delivered the main fintech journeys: authentication, KYC/KYB, portfolios, investments, transactions, marketplace and documents.
Behind those flows, I built a cache-first data layer and an Alamofire-based API layer for development, staging and production. Push notifications, deep links and Unleash feature flags supported the product journeys, while Amplitude, Sentry, Firebase and Xcode Cloud covered observability and delivery.

ソラミツ SORAMITSU | 2016-2025

iOS Developer

February 2022 - April 2022 (3 months)

Innopolis, Russia

Worked on SORA Wallet and its Polkaswap integration, adding iOS functionality for cross-chain token exchange across the Polkadot and Kusama ecosystems.
The role gave me hands-on experience with a production Web3 codebase built around Substrate. I contributed to the wallet's mobile flows and helped maintain the application distributed through the App Store.

MILEONAIR SOFTWARE DESIGN LLC

Senior iOS Developer

October 2020 - February 2022 (1 year 5 months)

Moscow, Russia

Built iOS functionality for MILE·ON·AIR, a loyalty ecosystem connecting airport-related partners through a shared rewards programme.
My work included CoreLocation and geofencing, Firebase Cloud Messaging, AppMetrica, advanced animations and custom zoomable interfaces. The application was built on the MobileUP framework and distributed through the App Store.

Cordis

Lead iOS Developer

November 2019 - September 2020 (11 months)

Saint Petersburg, Russia

Led iOS development of Cordis, a social discovery startup that matched people by personality and interests rather than appearance. I took the MVP from early product discussions to its App Store release.

The role went beyond implementation. I worked on product and UI/UX decisions in Figma, defined API contracts with the backend team and built the custom neomorphic interface and matching logic.
I owned testing and delivery, integrated Amplitude, AppMetrica, UXCam and AppsFlyer, and automated the release workflow with Fastlane.

HeksRay
Co-owner, iOS Developer, Project Manager
June 2016 - November 2019 (3 years 6 months)
Moscow, Russia

Co-founded a mobile development studio while studying at university.
I handled iOS engineering as well as requirements, estimates, client communication and delivery.
One of our products was a social network for speedcubers. I led its iOS development, and it reached the Top 7 in the App Store Sports category on its first day.
We also delivered a coaching platform connecting coaches and clients across several disciplines, plus an educational application for learning Chinese phonetics. Across these projects, I worked on architecture, performance, testing, release planning and post-launch support.

Qiwi
Summer Internship
June 2015 - August 2015 (3 months)
Moscow, Russia

Spent three months at QIWI writing Scala and learning how functional programming is applied in a production engineering environment.
I worked with the team’s Agile process and Git-based workflow while contributing to day-to-day development tasks.

Education

MIREA (Russian Technological University)
Master of Engineering, Applied Mathematics and Computer Science · (2013 - 2019)
